

## **ROBOTS WITH ARTIFICIAL INTELLIGENCE THAT CAN GUIDE THE TOURIST**

**My name is Arun Murali. I am an electronics engineer and always wanted to use my knowledge for the welfare of the nation and its citizens so they will remember my name when I die. So when I read about this competition I thought of contributing an idea to this esteemed and most promising industry we have- tourism. We could make fortunes with it.**

**Now my proposal is very simple. I have talked to many tourists in my area who often come to enjoy the sun bath in the beach. According to them they all have language problem which resists them from talking to native people and knowing about things. Also they don't know how to navigate to certain places and enjoy certain cuisines in Kerala. For example, whenever tourist come to ALAPUZHA they roam around in house boat, eat food provided by the owners of boats and go back. Not ot mention at exorbitant prices. They don't know about the beauties of backwater of places like Pulincunoo or the mesmerizing beauties of old homes in those areas. Similarly in other tourist spots too.**

**I propose idea of *TALKING BOTS*. A robot which could answer all the queries of the toursits . It could tell the best places present in the area and guide them to that place using GPRS. So places which don't have GPS also can be tracked. These will contain chips which could store the data of respective places which are entered by college students of those places especially who don't live there. That is because those people will know more about the place than the native. It is proven fact. As a result with a coglomerative effect we**

**could guide foreigners to good places and make them realize the beauties of India. Also with in hand phone numbers of police, hospitals etc which could provide them help at situations. Especially we would focus on woman. These would have inbuilt stun gun and pepper sprinter to save then and give them couple of time to run. In the mean time nearby police can help them.**

**All the information would be stored and changed into voice. So it would be interactive and they don't have to type but just ask questions.**

**All these would give an entirely new image to tourism. Also provide job opportunities to many as a result we could save a million, make a billion and perfect our image.**
